Actual generation as a percentage of average: 102.1% Cost per MWh: \$22.67

Western Area Power Administration (WAPA) generated a total of 18,583 gigawatt-hours (GWh) during October through June of fiscal year 2017, or 102.1 percent of the average. Actual purchase power data is currently available from October through May for all of WAPA's Regions, and during this period total purchase power was 2,518 GWh and total purchase power expenses were \$57,080,028, which equates to \$22.67 per MWh.

The following pages indicate WAPA's Regional snowpack, lake/reservoir inflow and content, generation, and purchase power expenses, among other things. Snowpack is reported as snow water equivalent, which is the depth of water that theoretically would result if the entire snowpack is melted instantaneously.

Lake/Reservoir Levels

Lake Powell's elevation was 3,635 feet at the end of June, about 65 feet below the maximum reservoir level and about 145 feet above the minimum generation level. The storage volume for Lake Powell was 15.41 million acre-feet at the end of June, which is about 63 percent of capacity.

Weather and Other Conditions

Current forecasts estimate Lake Powell elevation will be 3,631 feet at the end of water year 2017, about 20 feet higher than at the end of water year 2016.

Lake/Reservoir Levels

Lake Mead's elevation was 1,080 feet at the end of June, about 140 feet below the full storage level and about 130 feet above the new minimum generation level of 950 feet. Lake Mead started the water year with a minimum elevation of 1,076 feet in October and reached a peak elevation of 1,090 feet in February.

Weather and Other Conditions

The Desert Southwest Region's hydrology is mostly dependent on the Colorado River Basin snowpack and precipitation above Lake Powell. The water year 2017 precipitation is currently 109 percent of average.

Rocky Mountain Region

Lake/Reservoir Content

The overall reservoir content at the end of June was 121 percent of average.

Weather and Other Conditions

The Loveland Area Projects (LAP) area remains drought free but the trend is for drier conditions in some areas. The latest National Weather Service forecast indicates August through October temperatures are more likely to be above normal, and the precipitation is just as likely to be above as below normal in Wyoming and eastern Colorado while more likely to be above normal west of the Continental Divide in Colorado. LAP generation is expected to be less than the marketed amount through next March. Releases to evacuate space in reservoirs for the anticipated runoff required bypasses at some power plants, and a portion of the Yellowtail plant bypass was initiated at the request of WAPA to provide reserve capacity and regulating capability as other plants are loaded to capacity. Furthermore, Colorado-Big Thompson Project generation will be restricted during a Charles Hansen Feeder Canal siphon repair scheduled from August through mid-November.

Note: The Rocky Mountain Region's (RMR) most recent reported purchase power data are provisional values and may change.

Lake/Reservoir Content

As of June 30, accumulated inflow for the water year was 175 percent of the 15-year average for Trinity, 190 percent for Shasta, 298 percent for Folsom and 288 percent for New Melones. Reservoir storage as of the same date was 120 percent of the 15-year average for Trinity, 122 percent for Shasta, 127 percent for Folsom and 149 percent for New Melones.

Weather and Other Conditions

As of June 30, cumulative precipitation of the Northern Sierra Eight Station Index was at 187 percent of average for the date. May ended at only 17 percent of its monthly precipitation average; however, June ended at 87 percent of its monthly average. The May 1 forecast for the 50 percent exceedence case is the basis for the official year type declaration, which is "wet" for this water year.

Note: The Sierra Nevada Region's (SNR) average generation is based upon long-term modeling done for its "Green Book." SNR does not project purchase power expenses for dry conditions, and its most probable expenses are based upon term purchases of 35 to 65 percent of projected power needs, with the difference being left to day-ahead markets after project pumping and generation have been scheduled.

As of July 12, the active conservation pools for the Canyon Ferry and Yellowtail Dams were 98.9 percent and 100 percent full, respectively.

Weather and Other Conditions

The June runoff in the upper basin was 106 percent of average, with snowpack being the primary source of runoff in the Fort Peck and Garrison reaches. However, the lower basin had precipitation of less than 50 percent of average which resulted in below-average runoff for Oahe, Fort Randall, and Gavins Point. Drought conditions have been worsening this past month, with extreme drought in northeastern Montana, western North Dakota, and north central South Dakota. Two units at Fort Randall are out of service through the summer due to cable tray replacements.

Note: The Upper Great Plains Region reports its 50 percent share of generation from Yellowtail Dam, while RMR reports the snowpack, inflow, content, and remaining share of generation. Asterisks indicate that actual data is not available for the month.
