Actual generation as a percentage of average: 106.9% Cost per MWh: \$25.90

Western Area Power Administration (WAPA) generated a total of 24,998 gigawatt-hours (GWh) during October through August of fiscal year 2018, or 106.9 percent of the average. Actual purchase power data is currently available from October through July for all of WAPA’s Regions, and during this period total purchase power was 1,729 GWh and total purchase power expenses were \$44,785,095, which equates to \$25.90 per MWh.

The following pages indicate WAPA’s Regional snowpack, lake/reservoir inflow and content, generation, and purchase power expenses, among other things. Snowpack is reported as snow water equivalent, which is the depth of water that theoretically would result if the entire snowpack is melted instantaneously.

Cost per MWh: \$26.42

### Lake/Reservoir Levels

Lake Powell's elevation was 3,597 feet at the end of August, about 103 feet below the maximum reservoir level and about 101 feet above the minimum generation level. The storage volume for Lake Powell was 11.48 million acre-feet at the end of August, or about 47 percent of capacity. Lake Powell's August reservoir inflow was only 2 percent of average, which was the second lowest monthly amount on record.

### Weather and Other Conditions

Hydrologic conditions in the Upper Colorado River Basin continue to be very dry, possibly causing a reduction of releases from Lake Powell in water year 2019.

Actual generation as a percentage of average: 88.4%

Cost per MWh: \$66.71

### Lake/Reservoir Levels

Lake Mead's elevation was 1,079 feet at the end of August, about 141 feet below the full storage level and about 129 feet above the minimum generation level. Lake Mead reached an annual peak elevation of 1,088 feet in February and a minimum elevation of 1,077 feet in June.

### Weather and Other Conditions

The Desert Southwest Region's (DSWR) hydrology is mostly dependent on the Colorado River Basin snowpack and precipitation above Lake Powell. The precipitation was 67 percent of average at the end of August. The total side inflow into Lake Mead for water year 2018 is projected to be 712 thousand acre-feet, or 55 percent of the normal annual amount.

*Note: DSWR's projected dry and most probable generation data are reported from studies conducted by the U.S. Bureau of Reclamation.*

### Lake/Reservoir Content

Loveland Area Projects (LAP) area reservoir inflows were 72 percent of average at the end of August.

### Weather and Other Conditions

Hydrologic conditions for the LAP area can vary from one river basin and watershed to another. LAP is currently drought free from a water perspective due to storage. The latest National Weather Service forecast indicates October through December temperatures are more likely to be above normal in the LAP area. For LAP as a whole, October generation is expected to be below the marketed amount due to maintenance on hydro units. October through December generation in the Bighorn, Colorado, and North Platte River Basins is forecasted to be average for this time of year as the irrigation demands drop off.

*Note: The Rocky Mountain Region's (RMR) most recent reported actual generation and purchase power data are provisional values. RMR previously reported snowpack data as a total for all reservoirs throughout LAP, but is now reporting that data as an average value.*

### Lake/Reservoir Content

As of August 31, accumulated inflow for the water year was 45 percent of the 15-year average for Trinity, 68 percent for Shasta, 94 percent for Folsom, and 86 percent for New Melones. Reservoir storage as of the same date was 104 percent of the 15-year average for Trinity, 103 percent for Shasta, 99 percent for Folsom, and 134 percent for New Melones.

### Weather and Other Conditions

As of August 31, cumulative precipitation of the Northern Sierra Eight Station Index was at 82 percent of average for the date. The Sacramento River Index forecast for the 50 percent exceedence case is "below normal" and the 90 percent exceedence case is "dry."

*Note: The Sierra Nevada Region's (SNR) average generation is based upon long-term modeling done for its "Green Book." SNR does not project purchase power expenses for dry conditions, and its most probable expenses are based upon term purchases of 35 to 65 percent of projected power needs, with the difference being left to day-ahead markets after project pumping and generation have been scheduled.*

Actual generation as a percentage of average: 130.1%

Cost per MWh: \$21.55

### Lake/Reservoir Content

As of September 19, the active conservation pools for the Canyon Ferry and Yellowtail Dams were 87.6 percent and 93.5 percent full, respectively.

### Weather and Other Conditions

The August runoff was 138 percent of normal. Runoff was above average in the Fort Peck, Garrison, Gavins Point, and Oahe reaches, and below average at Fort Randall. The U.S. Drought Monitor shows that portions of the upper Missouri River Basin continue to be impacted by drought, with moderate drought (D1) and abnormally dry (D0) conditions present in much of North Dakota and north-central and central South Dakota. In addition, moderate drought (D1) conditions are present in northern and western Montana.

*Note: The Upper Great Plains Region reports its 50 percent share of generation from Yellowtail Dam, and RMR reports the snowpack, inflow, content, and remaining share of generation. Asterisks indicate that actual data is not available for the month.*
