Actual generation as a percentage of average: 65.6% Cost per MWh: \$43.20

Western Area Power Administration (WAPA) generated a total of 16,547 gigawatt-hours (GWh) from October through August of fiscal year 2022, or 65.6 percent of average. Actual purchase power data is currently available from October through July for all of WAPA’s Regions, and during this period total purchase power was 3,755 GWh and total purchase power expenses were \$162,202,385 which equates to \$43.20 per MWh overall.

The following pages indicate WAPA’s regional snowpack, lake/reservoir inflow and storage, generation and purchase power expenses. Snowpack is reported as snow water equivalent, which is the depth of water that theoretically would result if the entire snowpack melted instantaneously.

The monthly purchase power numbers in this report are used by WAPA’s regions as a forecasting tool; therefore, they do not reflect energy imbalance transactions and other such information that cannot be forecasted. Furthermore, the purchase power numbers have not been verified for financial auditing purposes. Consequently, these numbers will vary from those reported in WAPA’s year-end financial statements, and the latter should be considered the definitive source for WAPA’s purchase power data.

Lake/Reservoir Levels

End of August storage volume for Lake Powell was 5.94 million acre-feet (MAF) or about 25 percent of capacity. Lake Powell reservoir inflow for August was 368,000 acre-feet or 98 percent of average. Lake Powell elevation at the end of August was about 3,532 feet, or about 168 feet from maximum reservoir level and 42 feet from the minimum generation level.

Weather and Other Conditions

Dry conditions persist throughout the Colorado River Basin with much below average reservoir inflows forecasted for WY2023. Lake Powell will be in the Lower Elevation Balancing Tier for water year 2023 which requires Lake Powell to balance with Lake Mead while releasing between 7.0 and 9.5 million acre-feet of water. To help protect Lake Powell elevations, Reclamation will operate as if it is a 7.0 million acre-feet release year until April. In April, they will reevaluate whether hydrologic conditions will allow for balancing releases above 7.0 million acre-feet.

Lake/Reservoir Levels

Aggregate system storage for the Lower Colorado River Basin, or Lakes Mead, Mohave, and Havasu, was 9.55 MAF at the end of August, or 33.5 percent of the Lower Basin capacity. The Lower Basin tributary inflow into Lake Mead for August was 186,000 acre-feet. The total side inflow into Lake Mead for WY 2022 is projected to be 721,000 acre-feet, which represents a 29.4 percent increase over last year's actual of 557,000 acre-feet and 56 percent of the normal annual side inflow of 1.3 MAF. Lake Mead elevation at the end of August was 1,044.28 feet, or 175.36 feet below full storage elevation and 94.28 feet above the minimum generation elevation for Hoover Dam. In order to protect the target elevation at Lake Powell of 3,525 feet, Glen Canyon Dam has been withholding a total of 0.35 MAF of water from Lake Mead from January through April. This initial cutback in Lake Powell releases did not preserve Lake Powell elevation of 3,525 feet. Therefore, the decision has been made that the Lake Powell releases for WY 2022 will be reduced by a total of 480,000 acre-feet from 7.48 MAF to 7.0 MAF.

Weather and Other Conditions

The Desert Southwest Region's hydrology, or the Lower Colorado River Basin, is mostly dependent on the Colorado River Basin snowpack and precipitation above Lake Powell. The precipitation is currently 99 percent of average.

Cost per MWh: \$52.93

Lake/Reservoir Content

At the end of July reservoir inflows are 90 percent of average, and total system storage is 98 percent of average.

Weather and Other Conditions

LAP's hydrologic conditions can vary from one river basin and watershed to another. The runoff is complete, no snow accumulation yet. The latest National Weather Service forecast indicates October through December temperatures will most likely be above average in Wyoming and Colorado. The same forecast indicates precipitation will be below average for Wyoming and Colorado. Winter generation in the Colorado River Basin, the North Platte Basin and the Big Horn Basin is forecasted to be below average due to unit maintenance schedules.

Lake/Reservoir Content

As of August 31st, reservoir storage was 44 percent of the 15-year average for Trinity, 62 percent for Shasta, 91 percent for Folsom, and 51 percent for New Melones. Accumulated inflow was 48 percent of the 15-year average for Trinity, 62 percent for Shasta, 72 percent for Folsom, and 59 percent for New Melones. Sacramento River remains at minimum instream flow, while the Stanislaus ramped up briefly to meet critical year Vernalis flow requirement. Folsom Reservoir on the American River remained at relative high release to keep the Delta balanced while State and Federal pumping was minimal.

Weather and Other Conditions

June averages .97 inches, but 1.36 inches were recorded which is 140 percent of average. July averages 0.17 inches but only 0.04 inches were recorded which is 24 percent of average. August averages 0.26 inches, but 0.18 were recorded which is 70 percent of average. Based on May 1 conditions, the Sacramento Valley index at the 50 percent exceedance level is 4.5 or "critical," while the 90 percent exceedance level is 4.3 or "critical."

Note: The Sierra Nevada Region's average generation is based upon long-term modeling done for its "Green Book." The region does not project purchase power expenses for dry conditions, and its most probable expenses are based upon term purchases of 35 to 65 percent of projected power needs, with the difference being left to day-ahead markets after project pumping and generation have been scheduled.

Upper Great Plains Region

Actual generation as a percentage of average: 67.2%

Cost per MWh: \$33.56

Lake/Reservoir Content

The yearly runoff forecast for the Missouri River Basin as of Sept 1 was 20.2 MAF or 78 percent of average. Runoff above Sioux City for August was .857 MAF or 62 percent of average. System storage as of September 27 is 48.8 MAF.

Weather and Other Conditions

On July 3, the mountain snow water equivalent in the total above Fort Peck reach is 0.0 inches. The mountain snow water equivalent in the Fort Peck to Garrison reach is 0 inches. The "Total above Fort Peck" reach peaked on April 29 at 13.5" SWE and 85% of the normal peak. The "Fort Peck to Garrison" reach peaked on May 3 at 13.4" SWE and 92% of the normal peak. Parts of the High Plains region had rain while other parts were dry. Up to two inches fell locally in parts of several states. Especially dry areas occurred in parts of the Dakotas, Montana, Kansas, and Colorado. The lack of rain was accompanied by unusually hot temperatures regionwide, which accelerated the drying of soils. The 90- to 180- day outlook shows normal temperatures in most of central and eastern North Dakota, and slightly above normal temperatures in most of South Dakota and eastern Montana. North Dakota and the northern half of Montana are predicting normal precipitation, with the remainder of our territory slightly below normal precipitation

Note: The Upper Great Plains Region reports 50 percent share of Yellowtail Dam generation while Rocky Mountain Region reports the snowpack, inflow, content, and remaining share of generation. Asterisks indicate that actual purchase power data is not available for the month.
